

**Figure 5:** Bipartite plots showing changes in sandfly × vertebrate interactions based on sites binned by the amount of forest cover and categorized as intact (>60% forest) and deforested (<30% forest). The width of links is based on the strength (or number) of interactions between a sandfly species and the corresponding vertebrate species. The width of the nodes is based on the total number of interactions attributed to the taxon within the subsetted data. Domesticated species found with DNA metabarcoding have been excluded.
