

Greenhouse Effect does not exist

Brendan Godwin

16th April 2021

It has been said that we have a greenhouse effect or GHE and that the Earth's atmosphere lets visible light in from the Sun. This heats up the Earth's surface which radiates long wave InfraRed IR radiation. This IR radiation gets trapped in by so called greenhouse gases or GHG's and this heats up the Earth.

In this paper it will be shown that the trapping of radiation is false.

Definitions

Greenhouse Effect and Greenhouse Gases

These terms are extremely misleading and not correct. There are no such things as greenhouse gasses in the atmosphere and no such thing as a greenhouse effect. The analogy drawn is that the atmosphere acts like a real greenhouse. The glass roof lets in visible light that heats up the ground inside the greenhouse. The ground emits long wave infrared IR radiation. The glass blocks the IR and traps in the heat thereby heating up the greenhouse.

The claim is the atmosphere does the same. The atmosphere lets in visible light that heats up the ground which emits IR radiation. The so called greenhouse gasses in the atmosphere absorb the IR radiation and trap in the heat thereby heating up the atmosphere and the Earth.

This is all wrong. We've known for 200 years how greenhouses work and they don't work like this. The glass does let visible light in but absorbs and emits IR. Emissions are in all directions so half is emitted out into the atmosphere and half back inside the greenhouse. This is once again absorbed and re-emitted by the ground and back to the glass and the process repeats. The re-emission is now only half the original emission. Once again half of this goes out and half back in. So that's half of half or a quarter. That makes it exponential. After 5 iterations, the original incident packet of radiation is gone out into the atmosphere. So all the glass has done is delay by a matter of 30 microseconds the escape of this IR radiation out into the atmosphere. Remember that radiation is traveling at the speed of light.

Greenhouses actually work by the glass blocking convection.ⁱ This was even known by Fourier almost 200 years ago.ⁱⁱ

The atmosphere does have gases that absorb and emit IR radiation but they do not block convection, they do the same as the glass, they delay, only slightly, the escape of an incident packet of radiation from the Earth's surface back out to space. Nothing blocks convection except clouds at night.

These gases are properly termed Radiatively Active Gases or RAGs and the effect on the atmosphere is properly termed Adiabatic Thermal Enhancement or ATE.

InfraRed Electro Magnetic Radiation – EMR

IR radiation is Electro Magnetic Radiation or EMR. EMR travels at the speed of light. It is never stationary. As soon as it is absorbed by something it is immediately emitted within nanoseconds. Emissions are isotropic, i.e., they are in all directions at random. The GHE theorists will tell you that gases in the atmosphere and the glass in a greenhouse absorb IR EMR. They do not tell you that it immediately gets emitted. IR EMR takes a circuitous pin ball journey through the atmosphere, bouncing off molecules, sometimes returning to the Earth's surface to be absorbed and re-emitted, before escaping to space. Back-radiation from CO₂ molecules is at 14.6 micron wavelength. When absorbed and re-emitted by the Earth it is re-emitted at the full 1-100 micron spectrum wavelength and this escapes to space at a different frequency.

The time it takes IR EMR to escape Earth's atmosphere to space is between 2 and 30 milliseconds. Nothing gets trapped in the atmosphere.ⁱⁱⁱ

It is impossible for CO₂ to block the escape to space of IR radiation or to trap IR radiation. RAGs absorb and emit radiation, they don't absorb and stay absorbed. Water vapor dominates the IR absorption spectrum but even that doesn't trap IR radiation or block its escape to space. RAGs provide a small delay for IR radiation leaving the atmosphere with the vast majority of that delay coming from water vapor. And it is no different on Venus which has 96.5% CO₂ in its atmosphere. The delay times for IR radiation to exit the Venusian atmosphere is less than Earth because there is no water vapor in the Venusian atmosphere.

Discussion

The so called GHE theory has never been scientifically proven. This mythical warming of the atmosphere has never been measured.

For the GHE theory to be proved, proponents of it need to produce these measurements that show the Earth warming from the back-radiation from specifically CO₂ molecules, distinct and separate from the Earth being heated from direct solar radiation. That, *prima facie*, is impossible. The UN's IPCC admit they cannot prove the theory.^{iv} Wong & Minnett 2018 actually tried to do this and failed miserably.^v For their experiment they measured back-radiation from a clear sky but the signal was too weak to be useful. 99.9% of that back-radiation was from back-radiation from water vapor. Of the 0.1% that came from CO₂ molecules, just 4% of that was from human produced molecules. They then used radiation from clouds as a surrogate as this produced a useable signal. Most of this radiation was not actually back-radiation but rather reflected radiation from the water and ice in the clouds. A small amount only would have been back-radiation from water vapor. They tried to measure the warming

of the top micro-meters of the ocean surface skin layer. They had determined that IR EMR only penetrated water to the top couple of micrometers. The warming they measured from the reflected radiation from clouds was 0.0000000000°C. The warming from water vapor molecules was substantially less and from CO₂ molecules, to say immeasurable would be an understatement.

The only thing the proponents of the GHE theory have are climate models. These are more appropriately termed mathematical illusions. They are all built on false assumptions including giving CO₂ a radiative forcing factor. *Wong & Minnett 2018*^{vi} measured the radiative forcing factor for CO₂ at 0.0W m⁻². Despite that, models continue to assume a radiative forcing factor. *Thorstein & Olsen 2020* conducted an experiment using a manufactured Earth and atmosphere. They upped CO₂ in their atmosphere from 0.04% to 100% and measured 0.0°C of resultant warming.^{vii}

Summary

In the same way that IR EMR does not heat a greenhouse, it does not get trapped in the Earth's atmosphere, nor heat the Earth's atmosphere or the Earth. RAGs in the atmosphere do not block convection making it impossible for there to be a GHE. Consequently there can be no such thing as greenhouse gasses in the atmosphere. It is impossible to trap EMR in the atmosphere.
