1. Figure S1

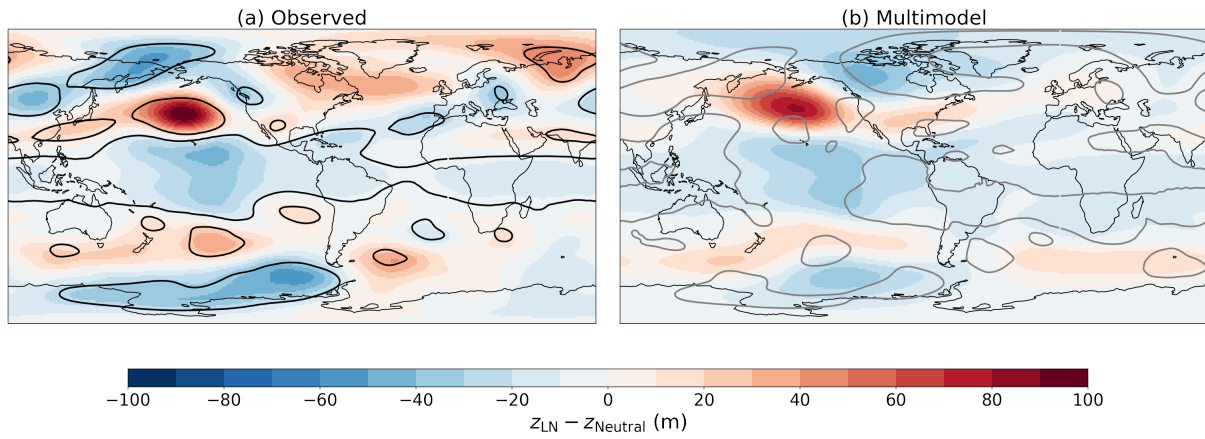

Figure S1. Geopotential height response to La Niña. Difference between La Niña and neutral composites of 300 hPa geopotential height for JRA-55 (a) and the mean of all five models (b). Black line contours on (a) bound regions where the La Niña and neutral years are significantly different above the 10% level in observations according to a two-tailed t test. Gray line contours on (b) bound regions where the modelled response is significantly different to the observed response at the 10% level according to a two-tailed t test.
